

## 6.8 Systems of linear equations (Gaussian elimination)

86a

Solve  $\underline{A}\underline{x} = \underline{b}$  by transforming  $\underline{A}$  to row echelon form

$$\left( \begin{array}{ccc|c} a_{11} & \dots & a_{1n} & b_1 \\ \vdots & & \vdots & \vdots \\ a_{m1} & \dots & a_{mn} & b_m \end{array} \right) \rightarrow \dots \rightarrow \left( \begin{array}{ccc|c} 1 & \dots & * & \tilde{b}_1 \\ 0 & \ddots & & \vdots \\ 0 & \dots & 0 & 1 & \tilde{b}_m \end{array} \right)$$

Does a solution  $\underline{x} = \begin{pmatrix} x_1 \\ \vdots \\ x_n \end{pmatrix}$  exist for  $m=n$ ?

(i)  $\text{rank } \underline{A} = n$  :  $\text{image}(\underline{A}) = \mathbb{K}^n \Rightarrow$  Unique solution exists.

(ii)  $\text{rank } \underline{A} < n$  : solution exists (but is not unique) if  $\underline{b} \in \text{image}(\underline{A})$

— does not exist if  $\underline{b} \notin \text{image}(\underline{A})$

## 6.9 Inverse matrix

Solution of  $\underline{A}\underline{x} = \underline{b}$  given by  $\underline{x} = \underline{A}^{-1}\underline{b}$  with  $\underline{A}^{-1}\underline{A} = \underline{A}\underline{A}^{-1} = \underline{1}$

Def.: A square matrix  $\underline{A} \in \mathbb{K}^{n \times n}$  is called invertible if a matrix  $\underline{A}^{-1}$  exists with  $\underline{A}^{-1}\underline{A} = \underline{A}\underline{A}^{-1} = \underline{1}$ .

condition:  $\text{rank } \underline{A} = n \Leftrightarrow \det \underline{A} \neq 0$

•  $\underline{A} = \begin{pmatrix} a & b \\ c & d \end{pmatrix} \Rightarrow \underline{A}^{-1} = \frac{1}{ad-bc} \begin{pmatrix} d & -b \\ -c & a \end{pmatrix}$  (Cramer's rule (if  $ad-bc \neq 0$ ))

• Find inverse  $\underline{A}^{-1}$  by transforming

$$(\underline{A} | \underline{1}) \rightarrow (\underline{1} | \underline{A}^{-1})$$

## 6.10 Determinant

Def:  $\underline{A} = \{a_{ij}\}_{i,j=1,\dots,n} \in \mathbb{K}^{n \times n}$

remove  $i$ -th row,  $j$ -th column

We define: for  $n=1$  :  $\det \underline{A} = a_{11}$

$$\begin{aligned} \text{for } n \geq 2 : \det \underline{A} &= \sum_{i=1}^n (-1)^{i+1} a_{i1} \det(\underline{A}_{i1}) \\ &= \sum_{s=1}^n (-1)^{1+s} a_{1s} \det(\underline{A}_{1s}) \in \mathbb{K}^{(n-1) \times (n-1)} \\ &= \sum_{r=1}^n (-1)^{1+r} a_{1r} \det(\underline{A}_{1r}) \end{aligned}$$

• Sarrus rule:  $\underline{A} \in \mathbb{K}^{3 \times 3}$

$$\det \underline{A} = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} = a_{11}a_{22}a_{33} + a_{12}a_{23}a_{31} + a_{13}a_{21}a_{32} - a_{13}a_{22}a_{31} - a_{11}a_{23}a_{32} - a_{12}a_{21}a_{33}$$

$$\bullet \det \underline{A}^T = \det \underline{A}$$

$$\bullet \det \underline{A} \underline{B} = \det \underline{A} \det \underline{B}$$

$$\bullet \det \underline{A}^{-1} = \frac{1}{\det \underline{A}}$$

$$\bullet \det \underline{A} = 0 \Rightarrow \text{rank} \underline{A} < n \quad (\text{singular})$$

$$\bullet \det \underline{A} \neq 0 \Rightarrow \text{rank} \underline{A} = n \quad (\text{regular})$$

ex.  $\det \begin{pmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{pmatrix} = 0$  (columns linearly dependent)

$$2 \begin{pmatrix} 2 \\ 5 \\ 8 \end{pmatrix} = \begin{pmatrix} 1 \\ 4 \\ 7 \end{pmatrix} + \begin{pmatrix} 3 \\ 6 \\ 9 \end{pmatrix}$$

$$\bullet \det \underline{A} = \begin{vmatrix} a_1 & c_1 & d_1 \\ a_2 & c_2 & d_2 \\ a_3 & c_3 & d_3 \end{vmatrix} = b \cdot (\subseteq \times d) \quad (\text{triple product})$$

## 6.12 Eigenwertproblem

9.0

Frage/Idee: Finde Basis, für die eine gegebene Matrix  
Diagonalform bekommt

$$\underset{B}{L} \underset{B}{B} = \begin{pmatrix} \lambda_1 & & 0 \\ & \ddots & \\ 0 & & \lambda_n \end{pmatrix} \Rightarrow \underset{B}{L} \underset{B}{B} \begin{pmatrix} v_1 \\ \vdots \\ v_n \end{pmatrix} = \begin{pmatrix} \lambda_1 v_1 \\ \vdots \\ \lambda_n v_n \end{pmatrix}$$

Def: Sei  $\underline{A} \in \mathbb{K}^{n \times n}$ .  $\lambda \in \mathbb{K}$  heißt **Eigenwert** von  $\underline{A}$ , wenn

$\Leftrightarrow$  Vektor  $\underline{v} \in \mathbb{K}^n \setminus \{0\}$  gibt mit  $\underline{A}\underline{v} = \lambda \underline{v}$ .

$\underline{v}$  heißt **Eigenvektor** zum Eigenwert  $\lambda$ .

Der Untervektorraum  $E_{\underline{A}}(\lambda) = \{ \underline{v} \in \mathbb{K}^n \mid \underline{A}\underline{v} = \lambda \underline{v} \}$

heißt **Eigenraum** zum Eigenwert  $\lambda$ .

Berechnung: Suche  $\lambda, \underline{v} \neq \underline{0}$  mit  $\underline{A}\underline{v} - \lambda \underline{1}_n \underline{v} = \underline{0}$

$$\Leftrightarrow (\underline{A} - \lambda \underline{1}_n) \underline{v} = \underline{0} \quad \text{lineares Gleichungssystem!}$$

$\Rightarrow$  nichttriviale Lösung ( $\underline{v} \neq \underline{0}$ ), wenn  $\det(\underline{A} - \lambda \underline{1}_n) = 0$

Def:  $\chi_{\underline{A}}(x) = \det(\underline{A} - x \underline{1}_n)$  heißt **charakteristisches Polynom** von  $\underline{A}$ .

Esgilt:  $\lambda$  ist Eigenwert von  $\underline{A} \Leftrightarrow \chi_{\underline{A}}(\lambda) = 0$  (Nullstelle von  $\chi_{\underline{A}}(x)$ )

Bsp: (i)  $\underline{A} = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix}$ :  $\lambda$  Eigenwert  $\Leftrightarrow \overset{\det(\underline{A} - \lambda \underline{1})}{|\underline{A} - \lambda \underline{1}|} = 0$

$$\Leftrightarrow \begin{vmatrix} -\lambda & 1 \\ 1 & -\lambda \end{vmatrix} = 0$$

$$\Leftrightarrow \lambda^2 = 1 \Rightarrow \lambda_1 = 1, \lambda_2 = -1$$

Eigenvektor zu  $\lambda_1 = 1$ :  $(\underline{A} - \lambda_1 \underline{1}) \underline{v}_1 = \underline{0}$

$$\begin{pmatrix} -1 & 1 \\ 1 & -1 \end{pmatrix} \begin{pmatrix} v_1^{(1)} \\ v_2^{(1)} \end{pmatrix} = \underline{0} \Rightarrow \overset{\uparrow}{v_1^{(1)}} = v_2^{(1)} \Rightarrow E_{\underline{A}}(1) = \text{span} \left\{ \begin{pmatrix} 1 \\ 1 \end{pmatrix} \right\}$$

$\underline{v} = \lambda \cdot \begin{pmatrix} 1 \\ 1 \end{pmatrix}$

Eigenvektoren zu  $\lambda_2 = -1$ :  $(\underline{A} + 1 \underline{1}) \underline{v}_2 = \underline{0}$

$$\Rightarrow \begin{pmatrix} +1 & 1 \\ 1 & 1 \end{pmatrix} \begin{pmatrix} v_1^{(2)} \\ v_2^{(2)} \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \end{pmatrix} \Rightarrow v_1^{(2)} = -v_2^{(2)}$$

$$\Rightarrow \underline{v}_2 = \alpha \begin{pmatrix} 1 \\ -1 \end{pmatrix}$$

$$\Rightarrow E_{\underline{A}}(-1) = \text{span} \left\{ \begin{pmatrix} 1 \\ -1 \end{pmatrix} \right\}$$

(ii) Rotation um  $\frac{\pi}{4} = 45^\circ$

$$\underline{A} = \begin{pmatrix} \cos \frac{\pi}{4} & -\sin \frac{\pi}{4} \\ \sin \frac{\pi}{4} & \cos \frac{\pi}{4} \end{pmatrix} = \frac{1}{\sqrt{2}} \begin{pmatrix} 1 & -1 \\ 1 & 1 \end{pmatrix}$$

$$\Rightarrow \chi_{\underline{A}}(\lambda) = |\underline{A} - \lambda \underline{1}| = \begin{vmatrix} \frac{1}{\sqrt{2}} - \lambda & -\frac{1}{\sqrt{2}} \\ \frac{1}{\sqrt{2}} & \frac{1}{\sqrt{2}} - \lambda \end{vmatrix}$$

$$= \left( \frac{1}{\sqrt{2}} - \lambda \right)^2 + \frac{1}{2}$$

keine Nullstellen in  $\mathbb{R}$ , aber  $\mathbb{C}$ :  $\lambda_{1,2} = \frac{1}{\sqrt{2}} (1 \pm i)$

Im Komplexen ( $\underline{A} \in \mathbb{C}^{n \times n}$ ) faktorisiert:  $\chi_{\underline{A}}(x) = (\lambda_1 - x)^{k_1} \cdots (\lambda_r - x)^{k_r}$

mit  $k_1 + \dots + k_r = n$ .

$k_i$  heißt **algebraische Vielfachheit**

• die  $E_{\underline{A}}(\lambda)$  heißt **geometrische Vielfachheit**.

dim  $E_{\underline{A}}(\lambda) > 1$ :  $\lambda$  ist **entartet**.
