1 Kapitza's Pendel

1.1 Ergänze wo ein XXX steht

1.1.1 Wichtige Module

```
In [17]: import numpy as np
         import matplotlib.pyplot as plt
         from scipy.integrate import solve_ivp
         from matplotlib.animation import FuncAnimation
         from IPython.display import HTML
```

1.1.2 Parameter

```
In [18]: # Parameters
g = XXX          # gravity
m = XXX          # mass of pendulum
l = XXX          # length of pendulum arms
A = XXX          # amplitude
Omega = XX       # driving frequency
```

```
NameError                                                 Traceback (most recent call last)

Cell In[18], line 2
      1 # Parameters
----> 2 g = XXX          # gravity
      3 m = XXX          # mass of pendulum
      4 l = XXX          # length of pendulum arms

NameError: name 'XXX' is not defined
```

1.1.3 Bewegungsgleichung in Matrixform

```
In [19]: # Define the equation of motion
def eq_of_motion(t, y):
    phi, omega = y
    domega_dt = XXX
    return [XXX, XXX]
```

1.1.4 Numerische Lösung der Differentialgleichung

```
In [20]: y0 = [XXX, XXX] # initial conditions: [phi, omega]
t_span = (0, XXX)
t_eval = np.linspace(*t_span, 2000)

sol = solve_ivp(eq_of_motion, t_span, y0, t_eval=t_eval)

t = sol.t
phi = sol.y[0]
omega = sol.y[1]
```
